Automated and shared vehicles working group

Objectives et Participants

What are the comfort/discomfort factors for autonomous and shared mobility?

- Véronique Berthault , RATP
- Béatrice Cahour, CNRS Télécom Paris Tech
- Stéphanie Coeugnet-Chevrier, Vedecom
- Jean-Francois Forzy, Renault
- Luciano Ojeda, Robert Thai, PSA
- Anna Rossi, Samuel Baudu, Faurecia

A teenager girl returning home after a party using a shared Robotaxi

Autonomous vehicle for urban mobility

Source Renault: EZ-GO concept car

A teenager girl returning home after a party

A teenager girl returning home after a party

Odette is a high school student, <18 years old

Her parents accompanied her to a party at <20 kms from her home on a Saturday night

Around midnight, Odette returns home with a robot taxi in pool mode

At the end of the party, Odette is tired and does not want to be sociable with the other passengers

What happens if there is no driver anymore?

In the driver's absence the journey becomes similar to a long elevator trip with a stranger

The driver is the responsible element to make sure that everything goes well during the trip

FEELING OF SECURITY/SOCIAL INTERACTION: User needs

- Information about other passengers
 - Easy cancellation if we have no confidence in the people we shared the vehicle with
 - Be safe from potential assaults during travel
 - Access to a human connection if needed
 - Opportunity to express your feelings about security/social interaction
-
- Being able to choose the level of social interaction:
 - Interaction with friends
 - Rest
 - Being able to clearly signal the need for privacy
 - Individualized comfort (ex. thermal, acoustics...)

Bubbles of individual experience

Immersive sound experience

Climate Bubble

Personalization & real time

Need to gather data about the occupant

Next steps: experimental investigation to generalize the results of the study

Uber-pool user population that we will lead to project into a "driverless" Uber-pool service

- 1) Ask the participant about their Uber-pool service practice
- 2) Present them the characteristics of the autonomous robot taxi service
- 3) Lead the participant in the Guided Imaginary Projection
- 4) Ask the participant about the sources of comfort/discomfort
